

DIGITAL DATA STRATEGY FOR THE LAB

DAVE DORSETT

BIOIT WORLD
APRIL 16, 2019

DIGITAL DATA STRATEGY FOR THE LAB

- ▶ Implementation of laboratory information systems have generally been driven in a bottoms-up "transactional" manner: CDS, LIMS, ELN, LES, etc. are brought in to deliver specific capabilities in an organic fashion. As those implementations mount there are several significant implications, some of which are:
 - ▶ Overlaps among the systems become critical factors in the quality of information produced and determination of authoritative data.
 - ▶ Obtaining an end to end picture of the data from a scientific process requires significant depth of knowledge in and access to many systems.
 - ▶ Modifying or extending the processes served by the constituent systems becomes more and more challenging.
- ▶ At the same time, there are significant business drivers that are putting additional pressure on laboratory information, some of which are:
 - ▶ Handling of increasingly diverse drug products.
 - ▶ Meeting the increasing needs of the R&D organization to be flexible and responsive .
 - ▶ Improving the systematic management of product data and processes where data consistency and availability are critical.
- ▶ This current state leads to a need for a higher-level picture of laboratory data. This workshop will help frame the current state, opportunities and approaches to a achieving a holistic digital strategy for the lab, one that encompasses the relationships between systems and the lifecycle of data. Representative initiatives and roadmaps will be discussed emphasizing a pragmatic and actionable point of view.

WHO, ME?

Dave Dorsett, Principal Software Architect, Astrix Technology Group

- ▶ Dave Dorsett has more than three decades of experience in R&D informatics throughout the global pharmaceutical, chemical, and consumer goods industries. He has an extensive track record architecting, designing, and delivering commercial and in-house informatics solutions across the R&D spectrum, from early research through late-stage development and QC.

ddorsett@astrixinc.com

APPROACH FOR TODAY'S SESSION

- ▶ Very large subject, attempt is to emphasize practical matters
- ▶ Some demystifying thrown in, but no magic answers (sorry!)
- ▶ Need participation!!
 - ▶ Topics can go anywhere you want

PLAN FOR TODAY

- ▶ General organization
 - ▶ Background
 - ▶ Viewpoint
 - ▶ Examples
 - ▶ Practice
- ▶ Goal
 - ▶ You and I take away something non-trivial

3. Find x .

Here it is

BACKGROUND

LABORATORY INFORMATION SYSTEMS

- ▶ CDS
- ▶ LIMS
- ▶ ELN
- ▶ LES
- ▶ SDMS
- ▶ Inventory
- ▶ Metrology/Equipment Management
- ▶ EM
- ▶ PLM
- ▶ LIS
- ▶ Document Management
- ▶ Visualization
- ▶ Sample and inventory management
- ▶ Registration, tracking, chain of custody, disposal
- ▶ Experiment design and documentation
- ▶ Instrument data collection
- ▶ Work and resource management
- ▶ Instrument management and metrology
- ▶ Method documentation
- ▶ Specification Management
- ▶ Result validation
- ▶ Result aggregation
- ▶ Reporting and analytics

BUT TODAY...

- ▶ We are not going to dive into system specifics
 - ▶ ~~How do I know I need a LIMS, ELN?~~
 - ▶ ~~What makes a good LIMS, ELN...?~~
 - ▶ ~~What vendors should I consider...?~~
- ▶ The discussion today is about the eco-system

WHY DIGITIZE?

- ▶ Save time
 - ▶ Automate data collection and transfer
 - ▶ Review by exception
- ▶ Improve efficiency
 - ▶ Re-use data to minimize rework
 - ▶ Generate metrics
- ▶ Increase consistency
 - ▶ Electronic controls/workflows for reducing compliance risk
 - ▶ Eliminate repetitive tasks
- ▶ Reduce WIP
 - ▶ Visibility into processes

WHY NOT DIGITIZE?

- ▶ Security
 - ▶ Data breaches
 - ▶ Open to manipulation (what's real?)
- ▶ Overload
 - ▶ Overwhelmed humans (emails, texts, meeting requests, notes)
 - ▶ Loss of findability
- ▶ Complexity
 - ▶ Can you fix your own car?
 - ▶ Gadget reliance

~1970

~2010

SO... WHAT'S THE PROBLEM WITH I.T.?

- ▶ Too many systems
- ▶ People are doing too much work (human integrators)
- ▶ Systems are brittle and frozen (dead in-place)
- ▶ Systems are prematurely old, but too expensive to fix
 - ▶ Out of sync with the business needs
- ▶ System won't scale
- ▶ Project problems... can't seem to deploy

GENERAL STATE OF INFORMATION MANAGEMENT

- ▶ Relationships between our systems are not deep
 - ▶ Inadequate links between data and sources
 - ▶ Multiple sources of truth slowing down R&D (and tech transfer)
 - ▶ Manual integration through entry and re-entry, with entire organizational units dedicated to this
- ▶ No integrated workflow
 - ▶ No single picture of data for decision making
 - ▶ Resources are over- and under-perfomed and real-time status is inaccurate
 - ▶ Document-centric approaches prevent re-use of data and costly accessibility
- ▶ Limited inter-organization digital collaborative enablement
 - ▶ External collaborations are labor intensive, not data driven nor responsive

Opportunities!

ONE MAJOR COMMON FACTOR: COMPLEXITY

- ▶ Consequences of digitization
 - ▶ Therac-25 radiation therapy system accidents
 - ▶ Knight Capital algo-trading loss
 - ▶ Volkswagen diesel emissions scandal
 - ▶ Numerous smartphone photo “enhancements”
- ▶ Software is quicker, cheaper, faster than alternatives
- ▶ But the resulting complexity is costly
 - ▶ Network effect on cost
- ▶ Definitely true of COTS implementations
 - ▶ Over time the an emergent, irreversible architecture appears

VIEWPOINT

ARCHITECTURE

- ▶ A system architect's raison d'être is managing complexity
 - ▶ Design sustainable systems with long-term stability
 - ▶ Create flexibility for long-term use

*"If you think good architecture is expensive, try bad architecture."
- Brian Foote and Joseph Yoder*

PRINCIPLES OF SOFTWARE ARCHITECTURE

- ▶ Decompose large systems (and eco-systems) into components
- ▶ Encapsulate and abstract
 - ▶ Identify components of large systems and make them re-usable
- ▶ Drive coherency
 - ▶ Keep the related things together
- ▶ Limit coupling
 - ▶ Components shouldn't have deep knowledge (binding) of each other
- ▶ Parameterize
 - ▶ Generalizing *appropriately*

OK, AND NOW THE "S" WORD

- ▶ What is strategic?
 - ▶ Dictionary: "relating to the identification of long-term or overall aims and interests and the means of achieving them"
- ▶ Can anything pervasive be strategic?
- ▶ Is IT really just a Red Queen Race?

"The Red Queen has to run faster and faster in order to keep still where she is. That is exactly what you all are doing!"

ASPECTS OF IT STRATEGY

- ▶ Strategy is mostly human
 - ▶ For IT, at the seam of humans and technology
 - ▶ Needs to be conversational (think elevator speech)
- ▶ Not always disruptive
 - ▶ Make something a bit better can be strategic
 - ▶ Efficient
 - ▶ Provide additional insights on the previous and next step
 - ▶ Skip steps
- ▶ What is not your overall purpose is just as important
 - ▶ What NOT to do

CATEGORIZATION OF THE IT ECO-SYSTEM

- ▶ Infrastructure
- ▶ Fixed applications
- ▶ Configurable and customizable applications
- ▶ Data

INFRASTRUCTURE

- ▶ Fundamentals: create, move, store
 - ▶ Compute, network, disk
- ▶ Necessary but not sufficient for strategy
 - ▶ Want these reliable, robust, and cheap
 - ▶ All available as services - programmable
- ▶ Cost of connectivity cost is going to zero
 - ▶ Always on-line
 - ▶ Free from time/location (this is truly digital)

FIXED APPLICATIONS

▶ Examples

- ▶ email
- ▶ Document creation and management
- ▶ Spreadsheets

▶ Strategic?

- ▶ Yes: Lab Data all over them
- ▶ No: Ubiquitous

APPLICATIONS

- ▶ Examples
 - ▶ LIMS, ELN, Inventory...
- ▶ Are Applications Strategic?

CONFIGURE VS. CUSTOMIZE

- ▶ Definitions
 - ▶ Configurable is modification by declaration
 - ▶ Application process largely remains the same
 - ▶ Customization is modification by procedure
 - ▶ Custom-built application the obvious extreme
- ▶ Is Customization really that evil?
 - ▶ Customization is evil when the system isn't designed for it
 - ▶ Customization is the vendor get-out-of-jail card
- ▶ What about internal development then?
 - ▶ If you really cannot buy it and it's really needed, it must be strategic?

DATA

- ▶ Is just moving our systems out of paper enough to call ourselves “digitized”?
 - ▶ Is changing the representation of data necessary but not sufficient?
- ▶ Data flow - the transfer of data - is the real point of a holistic laboratory IT strategy
 - ▶ Data integrity throughout the lifecycle

CURRENT STATE: ECOSYSTEM OF DATA

Many data sets partially or fully replicated across multiple systems

- ▶ CDS
 - ▶ Instrument data and methods
- ▶ LIMS
 - ▶ Test definitions and specifications
 - ▶ Study plans (e.g. Stability)
 - ▶ Sample Management
 - ▶ Results
- ▶ LES
 - ▶ Test procedures
 - ▶ GMP controls
 - ▶ Review
- ▶ ELN
 - ▶ Experiment templates
 - ▶ Management of controls
- ▶ Inventory
 - ▶ Consumables and Standards
 - ▶ Log Books
- ▶ SDMS
 - ▶ Data archive
- ▶ Document management
 - ▶ Policies, SOPs, WIs, Forms
 - ▶ Filings
 - ▶ General controlled documents
 - ▶ Technical reports and presentations

*Where's the
authoritative
information here?*

HOLISTIC DATA LIFECYCLE

- ▶ Creation
- ▶ Use
- ▶ Augmentation
- ▶ Archival
- ▶ Deletion

- ▶ Also important
 - ▶ Governance
 - ▶ Quality
 - ▶ Repatriation

CATEGORIZATION OF DATA

- ▶ Use is a potential way to prioritize across the eco-system
 - ▶ Purely operational data
 - ▶ Regulatory compliance data
 - ▶ Process data – data about the business processes
 - ▶ Decision-able data
- ▶ Another viewpoint
 - ▶ Individual data – transactional data creation
 - ▶ Team data – functional data review
 - ▶ Organizational data – support for big decisions

HANDLING THE DATA YOU ALREADY HAVE

- ▶ Existing (legacy) data management is a significant challenge
 - ▶ More often punted down the field than addressed
- ▶ What can be done?
 - ▶ Archive
 - ▶ Migrate

INSTRUMENT (DATA) INTEGRATION

- ▶ A lot gets said about this
 - ▶ Look at the frequency of use, what results are critical, etc.
- ▶ But the tactics employed are still largely point to point and not general
 - ▶ Opportunity for abstraction
 - ▶ Instrument vendors have been anti-incentivized to address it
 - ▶ Systems vendors have not addressed in a sustainable way

SYSTEM INTEGRATION

- ▶ Integration of R&D systems has historically been point to point
 - ▶ Scalability and sustainability are serious challenges
- ▶ Enterprise-level integration is moving beyond a point to point view
 - ▶ “Enterprise Integration Platforms”
 - ▶ A collection of more-or-less ready to use patterns
 - ▶ Transformation, aggregation, notification, annotation, profiling, cleansing, masking
 - ▶ Central metadata store
 - ▶ Implementation tooling
 - ▶ Data virtualization, etc.

MATERIAL FLOW

- ▶ Yes, in an R&D IT discussion!
 - ▶ One of the more overlooked aspects of digital strategy
- ▶ Material flow is intertwined with data flow
 - ▶ We produce data because we produce materials
 - ▶ And we know what the material is because of the data we produce
- ▶ Identification and provenance of material is a critical data architecture problem
 - ▶ Needs to be stable over a long period of time across many systems

EXAMPLES

GENERAL NOTE

- ▶ Examples here (and discussed verbally) aren't about HOW
 - ▶ Could be a COTS system
 - ▶ Could be home-built

MATERIAL MASTER EXAMPLE: GOALS

- ▶ Information about materials (synthesis, history, treatment) is critical information
 - ▶ Across multiple sites and partners with all kinds of systems
- ▶ Information is highly valuable, and retains its value over time
 - ▶ Need to provide access to data from multiple sources with minimal effort
- ▶ Part of a changing work-processes
 - ▶ In the olden days, registration was used as a stage-gate to provide material identification
 - ▶ Increased speed and parallelization of research makes this no longer viable

MATERIAL MASTER EXAMPLE: SCOPE

1. Existence

- ▶ Fundamental knowledge that a material exists somewhere with some name
 - ▶ *Do you know Sam?*

2. Equivalence

- ▶ Recognition that materials go by multiple names (even in a single source system)
 - ▶ *Who you call Sam, I call Samantha, and they're the same person!*

3. Metadata

- ▶ Source systems all contain business data about their materials
 - ▶ *What can you tell me about Sam/Samantha?*

4. Material Instance data

- ▶ Access to data from source system
 - ▶ *Please provide Sam's address and phone number*

SEMANTIC DATA AGGREGATION: GOALS

- ▶ Use real-time data to identify critical product quality and performance parameters
 - ▶ Digitize the Technical Report
 - ▶ Use increasing process knowledge for near-continuous review of limits and to drive more efficient processes
- ▶ Generate the Technical Report as-needed, and from current data
- ▶ Support collaboration with a shared view of all data

SEMANTIC DATA AGGREGATION: SCOPE

- ▶ Just about everything!
 - ▶ ELN, LIMS, Inventory, Instrument data...
- ▶ Mash it all together?
 - ▶ Technically making it happen not a challenge ("big data")
 - ▶ Making it meaningful...

- ▶ Leads right in to...

MASTER DATA MANAGEMENT: GOALS

- ▶ Bring categorical data into alignment
 - ▶ Standardize on the semantics of data used to categorize other data
 - ▶ Establish authoritative attributes and criteria
 - ▶ Establish ontologies independent of systems
- ▶ Aligned with the system integration data flow needs
- ▶ Enormously impactful on data quality even within individual systems

- ▶ A. Huge. Project.

"Now that you have an overview of the system,
we're ready for a little more detail"

MASTER DATA MANAGEMENT: SCOPE

PRACTICE

PBR

- ▶ Plan
- ▶ Build
- ▶ Run

- ▶ Well...
 - ▶ Build-build-plan-build-run... oops.
 - ▶ Plan-build-build-plan-run-build-run-build-run

THE UGLY REALITY

- ▶ Projects fail. And fail. And fail.
 - ▶ Are we really getting better?
 - ▶ 25% of companies have had successful IoT initiatives (Cisco, Feb 2018)
 - ▶ Harvard Business Review found that:
 - ▶ Less than half of structured data is actively used in decision making
 - ▶ Less than 1% of unstructured data is analyzed or used at all

THE THINGS WE SAY...

- ▶ Versus what we do:
 - ▶ Tolerate poor communication
 - ▶ Make no plans for iteration
 - ▶ Design with no resilience for change
 - ▶ Over analyze, over design, over engineer
 - ▶ Ignore risk
 - ▶ Assume technology can fix business problems

YES, THIS AGAIN...

PLAN

▶ Holistic Requirements

- ▶ Why are we implementing this given what we already have?
- ▶ What must it do uniquely?
- ▶ What must it accede to?
- ▶ How will we measure it?

▶ Requirements and Road maps

- ▶ Road Maps can help to manage scope creep
- ▶ But remember that a thorough requirement process leads to more requirements
 - ▶ Aside: I don't think we know how to do requirements

BUILD

- ▶ People Factors are critical to Build success
 - ▶ Project manager:
 - ▶ Communication, gap-filling, push/pull on the others
 - ▶ Tech lead
 - ▶ Broad experience vs deep based on project
 - ▶ Business empathy
 - ▶ Business lead
 - ▶ Technical empathy
- ▶ Holistically impactful things to do, as a team
 - ▶ Put the risks on the table
 - ▶ Drive a comprehensive testing strategy
 - ▶ Occasionally pull the focus up from the Build

RUN

- ▶ Focus of Plan-Build is meeting the functional requirements
- ▶ But after a year, or 2, or 5... (sometimes less)
 - ▶ The biggest issues are the non-functional requirements
- ▶ Plan and Build must incorporate Run (the “-ilities”)
 - ▶ System administration (e.g. how incidents can be diagnosed)
 - ▶ Updating (even minor updates)
 - ▶ Performance + reliability + scalability
 - ▶ Flexibility (new integrations)
 - ▶ Usage (operational monitoring)

HANDLING THE “-ILITIES”

- ▶ Consider points of failure
- ▶ Consider diagnosis and traceability
- ▶ Practice configuration engineering
 - ▶ Automation/software-define infrastructure
 - ▶ Load balancing
- ▶ Performance testing
 - ▶ With remediation plans!

GOTCHAS

- ▶ No roadmap
 - ▶ Right problem, wrong solution
- ▶ Testing strategy
 - ▶ Code review is hard. Testing isn't.
- ▶ Focusing on the technology (not strategic)
 - ▶ Wrong problem, right solution
- ▶ Underestimation of complexity

A ROADMAP??

- ▶ Exactly like what you would take on a month-long trip to a completely unknown place
 - ▶ Maps
 - ▶ Dictionaries
 - ▶ Dos and Don'ts
- ▶ It should be agile
 - ▶ Not overly prescriptive
 - ▶ Explicitly not make all decisions
 - ▶ Keeps the bigger picture in mind

ROADMAP DOS AND DON'TS

▶ Do

- ▶ Provide multiple candidate approaches with trade-offs
- ▶ Describe a deliverable real-world system
- ▶ Identify risks and possible mitigations
- ▶ Address organizational disruption
- ▶ Provide guidance for making and reviewing directional decisions

▶ Don't

- ▶ Be fully prescriptive, especially towards the distant future
- ▶ Be completely non-prescriptive (slideware)
- ▶ Ignore risks
- ▶ Ignore implementation
